The new HQ is one of the first Passive House Office Buildings in Denmark

Following are the basic features that distinguish passive house construction:

Passiv House Definition:

A passive house is a building in which a comfortable interior climate can be maintained without active heating and cooling systems (Adamson 1987 and Feist 1988). The house heats and cools itself, hence "passive".

Max. 15 kWh/m² heating demand

Max. 120 kWh/m² total primary energy
(heating, hot water, electricity)

Compact form and good insulation:	All components of the exterior shell of the house are insulated to achieve a U-factor that does not exceed 0.15 W/(m ² K) (0.026 Btu/h/ft ² °F).
Southern orientation and shade considerations:	Passive use of solar energy is a significant factor in passive house design.
Energy-efficient window glazing and frames:	Windows (glazing and frames, combined) should have U-factors not exceeding 0.80 W/(m ² K) (0.14 Btu/h/ft ² °F), with solar heat-gain coefficients around 50%.
Building envelope air-tightness:	Air leakage through unsealed joints must be less than 0.6 times the house volume per hour.
Passive preheating of fresh air:	Fresh air may be brought into the house through underground ducts that exchange heat with the soil. This preheats fresh air to a temperature above 5°C (41°F), even on cold winter days.
Highly efficient heat recovery from exhaust air using an air-to-air heat exchanger:	Most of the perceptible heat in the exhaust air is transferred to the incoming fresh air (heat recovery rate over 80%).
Hot water supply using regenerative energy sources:	Solar collectors or heat pumps provide energy for hot water.
Energy-saving household appliances:	Low energy refrigerators, stoves, freezers, lamps, washers, dryers, etc. are indispensable in a passive house.

Bygningsdirektivet – en hjælp Nye energirammer april 06 / BR08

- opvarmning
- varmt brugsvand
- ventilation
- køling
- elforbrug (boliger kun basisdrift) x 2,5

Danish Energy Regulation

$$(95 + \frac{2200}{A}) \text{ kWh/m}^2 \text{ pr. år,}$$

hvor A er det opvarmede etageareal.

Nybyggeri (ex 150m²)

Standard boliger

$$70 + 2200 : A = 85 \text{ kWh/m}^2/\text{år}$$

LE 2

$$50 + 1600 : A = 61 \text{ kWh/m}^2/\text{år}$$

LE 1

$$35 + 1100 : A = 42 \text{ kWh/m}^2/\text{år}$$

$$17,5 + 550 : A = 21 \text{ kWh/m}^2/\text{år}$$

Standard andet

$$95 + 2200 : A = 110 \text{ kWh/m}^2/\text{år}$$

LE 2

$$70 + 1600 : A = 81 \text{ kWh/m}^2/\text{år}$$

LE1

$$50 + 1100 : A = 57 \text{ kWh/m}^2/\text{år}$$

Dansk Passivstandard (på vej)

$$23,7 + 550 : A = 27 \text{ kWh/m}^2/\text{år}$$

Danish Energy Demand – overview

Energy balances – Annually energy demand and annually energy performance

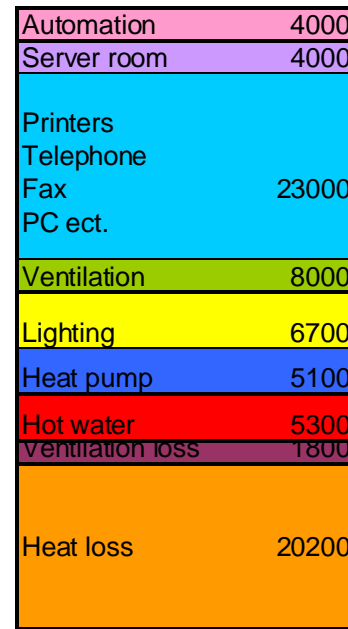

Energy demand

58 kWh/m2 office building

Energy performance

65 kWh/m2 office building

Energy demand

78100 kWh/year

Energy performance

87300 kWh/year

+ 10% energy surplus

Energy demand

Total 58 kWh/m²

Primary Energy – building operation
 $15 \cdot 1 + (1 + 4 + 4 + 5 + 6) \cdot 2,5 = 65 \text{ kWh/m}^2$

Primary Energy – all installations
 $15 \cdot 1 + 43 \cdot 2,5 = 123 \text{ kWh/m}^2$

Energy strategies – passive strategies

- Minimization of passive solar heating in the summer – glazing, orientation
- 500 mm insulation of building envelope $U = 0,1 \text{ W/m}^2\text{°C}$ – Light weight construction
- No thermal bridges
- Low energy windows $U = 0,8 \text{ W/m}^2\text{°C}$
- Light transmission through glazing areas
- No central heating
- Natural ventilation in summer
- Mechanical ventilation in winter

Some priorities:

- Low energy demand
- Manual operation
- Visible and honest – it is what you see
- No noisy ventilation systems
- Indoor climate – thermal/atmospheric

Energy strategy – technologies

- Solar Heating (domestic hot water) 15 m²
- Mechanical ventilation in winter with heat recovery (85%)
- BIPV in roof and SE-façade - 450 m² + 220 m²
- PVT on roof area over parking area (electricity + hot air)
- Heat pump for central preheating of ventilation air

PV – Composite Facade

PV – Composite Facade

- Black Siemens mono crystalline solar cells (156 x 156 mm)
- Profiles 500 x 1620 mm horizontally
- Lamination directly on profiles
- Alternatively glued with clear TESA tape
- Junction box on the back
- On roof single layered glass is used as front covering
- 50 mm ventilated cavity – openings in top and bottom (preheating/cooling)

The Pattern

Danish Energy Management

A part of Danish Management Group

The Pattern – flexibility

PV – Costs and Performance (incl. VAT 25%)

- PV Cost ~ 4,6 mill dkr/614.000 Euro
- PV Cost pr. m² ~ 6.800 dkr/906 Euro/m²

Performance:

Roof – 92 kWh/m² (Amorpheus 44 kWh/m² / 4.400 dkr/m²)

Facade – 73 kWh/m²

Solarzellentyp	Labor	Prototyp-/ Pilotfertigung	Produktion
monokristallines Silicium c-Si	24 %	21 %	14 - 18 %
multikristallines Silicium mc-Si	20 %	18 %	12 - 14 %
Galliumarsenid GaAs	30 %	26 %	22 %
amorphes Silicium a-Si	13 %	10 %	5 - 8 %

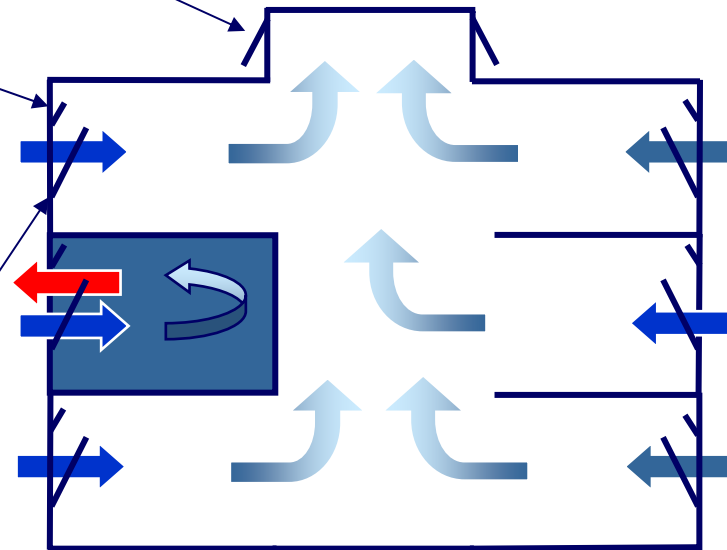

Natural ventilation

Openings in the skylights and ...

...ventilation openings located in narrow window bands above the ordinary windows in the offices are equipped with electronic actuators. The openings can be left open during night-time.

The ordinary windows in the offices are manually controlled. The windows must be closed during night-time due to security reasons.

DMG HQ and Economy (Incl. VAT 25%)

1500 m²

Total cost without grant:

32 mill dkr (4,3 mill. Euro) / 21.000 kr/m² (2.850 Euro/m²)

Applied for app. 4 mill dkr

Total cost with grant:

28 mill dkr (3,7 mill. Euro / 18.700 kr/m² (2.500 Euro/m²)

Proposals for grant:

”Development and Demonstration of New PV-Composite Profiles”

”Building Integrated Photo Voltaic – Direct Current”

Other technologies taken into consideration

- PCM (Phase Changing Material)

Modern lightweight architecture

Heavy old building

PCM is very small capsules with a core of wax with a melting point at 23°C or 26°C

The theory:

When a material changes from one form to another the temperature is constant during this phase.

Think of a drink:

As long as you have ice in the drink the temperature is 0 °C. When the ice is melted the temperature rises.

The melting energy is taken from the water.

PCM is the **ONLY** technology, which is able to **STOP** temperature increase at indoor application, without causing energy expenses

Ready-to-use
Micronal® PCM SmartBoard™ 23/26

Length	2,00 m
Width	1,25 m
Thickness	15 mm
Weight	11,5 kg/m ²
PCM content	ca. 3 kg dry/m ²
Heat capacity (latent)	ca. 330 kJ/m ²

Phase Changing materials – cooling and heating

The cooling process:

The sun is shining

The PCM material is warmed up

At 23 °C the PCM is melting

The heat to makes PCM melting is taken from the indoor air

The temperature in the construction (wall/floor/ceiling) is constant during the melting process.

When all the PCM has melted the temperature will rise again

During night the PCM-construction could be cooled by natural ventilation.

Result:

Cooling energy and ventilation is reduced

The heating process:

In the night the temperature will fall

The PCM material is hardening

The temperature in the construction is constant during the hardening period

When all the PCM has hardened the temperature will fall again

Result:

Heating energy can be reduced
